PROPOSED TASK

Online appointment and consultation

- An online appointment booking system is a web-based platform or software allowing individuals to schedule appointments conveniently over the internet with businesses or service providers. It typically provides a user-friendly interface for users to view available time slots, select desired dates and services, and secure appointments, streamlining the booking process for customers and service providers. The customer just needs to attend the appointment on time and get the treatment right away. Therefore, when an appointment system is integrated with a customer journey management system, also known as queue management system, it becomes a powerful system that enables organizations to move customers seamlessly from an online to in-person visit.

Health scanning

- Health scanning is a technology that provides a quick and easy way to evaluate your health. It uses tools like imaging and sensors to gather information about your body. The process is simple and non-invasive, meaning it doesn't cause any discomfort. You can get scanned and immediately see the results, which include detailed information about your health. Doctors will automatically get the result of the health information from the device, it helps doctors keep track of your health over time, make better decisions, and provide personalized care. This way, you get continuous monitoring and timely help, making healthcare more efficient and effective

Centralizing medical record

- We are going to merge all previous medical records into a single, comprehensive system that will be accessible to all medical providers. This combined database will considerably improve doctors' decision-making processes by providing them with a complete and accurate picture of each patient's medical history. Doctors who have rapid access to detailed medical records can make more precise and responsible choices, lowering the risk of prescribing unsuitable medications and avoiding potential negative outcomes. This better access to patient history will not only speed up treatment processes, but will also improve patient safety and care quality. Furthermore, it will improve communication between healthcare providers, resulting in a more organized and effective approach to patient care.

PERSONA

1. Persona 1

Muhammad Sumbul is a 32 years old employee who works as an auditor. He usually goes to work at 8am until 5pm. He always prioritized his work over anything else which made him care less about his health. Due to his busy work, the habit of not wasting time made him overwork sometimes. Whenever he gets sick, he prefers not to go to the clinic instead work at home because waiting time at clinic is too long. Besides, it is just a light disease and also he is too busy to waste time waiting for turn to meet the doctor. Additionally, waiting time just to take medicine is much longer. The thought of a lot of time wasted makes him frustrated and impatient. Plus, there might be a lot of sick people who also wait for their time. He is afraid that he might be infected with another disease.

He wishes to have something that can help him reduce the time to get medicine from the clinic. It is something that will give him the required medicine once he arrives at the clinic. The only thing he wants is to just take medicine on time and waste no time.

2. Persona 2

Emma, a vibrant 55-year-old businesswoman, founded a successful bakery in her 30s because she had a strong passion for desserts. Her regular consumption of high-sugar foods over time resulted in a diabetes diagnosis in her early 50s. Her everyday routine has been greatly impacted by managing this chronic illness, which calls for close monitoring of her diet, consistent exercise, and frequent check-ups at her closest healthcare provider to maintain control over her blood sugar.

The annoying administrative process is one of the most annoying parts of her frequent medical visits. Emma has to write out her whole medical history each time she schedules a visit or shows up for a checkup which she finds to be tedious. She wishes for an effective system that would free her from having to repeatedly provide the same information to any healthcare provider by enabling her to securely share her entire medical record with them. This would enable her to concentrate more on her health and her business while saving her a significant amount of time and easing the stress related to managing her condition.

3. Persona 3

John is a 35-year-old freelance graphic designer who contracted COVID-19 a few months ago. Despite recovering from the initial infection, he continues to suffer from persistent symptoms such as fatigue, brain fog, shortness of breath, and occasional chest pain. These ongoing symptoms are commonly referred to as Long COVID. Long COVID means that even after the acute phase of the infection has passed, a person continues to experience symptoms that affect their daily life and health.

John's Long COVID symptoms have significantly disrupted his daily routine and work life, requiring frequent medical attention and constant health monitoring. He finds it a hassle to regularly visit various specialists for check-ups and struggles with keeping track of his medications and managing their side effects. The unpredictability of his symptoms also causes anxiety and depression, further complicating his condition. Moreover, John is constantly worried about the possibility of spreading the virus to others, which makes him anxious about social interactions and reluctant to leave his home. John wishes for a more convenient way to manage his health, monitor his symptoms, and ensure he doesn't pose a risk to others, allowing him to maintain his productivity without constant disruptions.

SCENARIO

Health Scanning

It's Monday in the morning. Mr Muhammad Sumbul is having a fever but he needs to go to work. Then, he opens the *HealthMax* that can directly scan him from his home. The robot is connected to an app that can directly inform him what disease that he is having and also know how condition he is in. Thus, a clinic that received the information about the diseases can prepare the medicine. The staff at the clinic then will stand by a suitable medicine for him based on the diagnosis details and also from a doctor's suggestion.

If his health is in a worse condition after doing a health scan, he must make an immediate appointment to a doctor and get treatment right away. Otherwise, if the person only has a light disease, then a clinic just informs him what time he can take the medicine. So that, while waiting at home, he can continue his work without worrying about his sickness. This will make him feel relieved, it's like two birds with one stone.

Centralizing medical record

Emma must visit the medical institution three times per week to treat her diabetes, a chronic illness. As a business owner, she routinely travels across states and districts to ensure that her stall is running smoothly and efficiently. During her travels, she visits the nearest medical center for her daily checkups. Previously, Emma had to redeclare her medical history every time she visited a new facility, which was both time-consuming and stressful.

However, since she began using our function, which centralizes all medical records in one place, her experience has significantly improved. Her whole medical history is now easily accessible to healthcare providers at whatever medical facility she attends. This easy access to her records reduces Emma's need to regularly update new doctors on her illness and treatment history. As a result, she may receive consistent and accurate care no matter where she is. This centralized approach not only makes Emma's life easier, but it also guarantees that she gets the finest care available, which improves her overall health management and quality of life.

Online appointment and consultation

John must frequently consult with specialists to manage his Long COVID symptoms, which include fatigue, brain fog, and shortness of breath. As a freelance graphic designer, he needs a flexible healthcare solution that fits his unpredictable schedule and allows him to avoid unnecessary travel due to his condition and anxiety about spreading the virus.

Since John began using HealthMax, his experience has significantly improved. HealthMax, a robot developed to facilitate online appointments and consultations, allows John to schedule virtual visits with his healthcare providers from the comfort of his home. He can easily manage his appointments and medications through HealthMax's user-friendly interface. This convenience reduces his stress and fatigue, ensuring he receives consistent care without disrupting his work. HealthMax also offers a secure messaging feature, enabling John to stay in touch with his doctors between appointments, providing him with continuous support and peace of mind. This approach has improved John's health management and overall quality of life, allowing him to focus more on his work and personal well-being.
