

GROUP 2 ASSIGNMENT 3

UTHM INDUSTRIAL VISIT

Summary

On 3 December, we had the opportunity to participate in an industrial visit to Universiti Tun Hussein Onn Malaysia (UTHM). This visit allowed us to gain exposure to their data center and better understand their daily operational processes.

During the session, they shared UTHM's core ICT strategies and objectives, which are structured into four key phases. We also learned about their Enterprise Architecture initiative, which is currently ongoing and is expected to be finalized by mid-2026.

In addition, they explained the Enterprise Architecture framework that defines the relationships between users, key services, responsibility centers, and technology in supporting ICT operations as well as the implementation of academic and institutional projects at UTHM.

Technologies Used

UTHM uses digital technology to support learning, administration, and daily operations. Online platforms, shared databases, and cloud systems help students and staff access information, communicate, and work efficiently. They are currently building a new three-tier data center to support its digital systems. It will have a hot and cold aisle system for efficient cooling and to support educational purposes. The facility will include monitoring and staging rooms for equipment management, as well as backup generators and UPS to keep systems running.

Issues Discussed

UTHM faced an issue with building their own Enterprise Architecture (EA). As UTHM has built its own data center, they are required to present a functional EA where it shows how all the systems and data are managed in UTHM. However, due to the lack of expertise, they still haven't come up with an EA that actually depicts their system. During our visit, UTHM mentioned that they are open to UTM students presenting EAs for them and that they would consider adopting it if it's suitable. Apart from that, UTHM's data center hasn't been fully launched yet as they are still in the process of migrating hardware and software to their new data center.

Reflection

Nawwarah Auni binti Nazrudin (A23CS0143)

During the industrial visit, I learned how UTHM uses different digital systems to manage student and administrative information. I also thought about how using an enterprise system could help bring all these systems together and make them easier to manage.

Harini A/P Sangaran (A23CS0081)

Through the industrial visit, I gained a deeper understanding regarding UTHM's systems via the explanation given by the representatives and also by asking questions to clear out our doubts. To add on, I also learned about the components and properties of a data center.

Muhammad Afiq Danial bin Rozaidie (A23CS0117)

From this visit, I learned how Enterprise Architecture helps align systems with organization's goals and operations. Seeing how UTHM structures its EA gave me a clearer understanding of how technology, services, and users are connected in a real environment.

Ahmad Ziyaad bin Mohd Abbas (A23CS0206)

From the visit, I learned how UTHM manages its data center and uses Enterprise Architecture to plan future digital systems. The session helped me understand the challenges of hardware and software migration and how phased implementation supports smoother transitions. Overall, it gave me clearer insight into how ICT infrastructure supports university operations.
