SECP3744 ENTERPRISE SYSTEMS DESIGN AND MODELING (WBL)

INDIVIDUAL ASSESSMENT - SAP BTP

SECTION 01

LECTURER: DR. ARYATI BINTI BAKRI

NAME	MATRIC NUMBER
MUHAMMAD AFIQ DANIAL BIN ROZAIDIE	A23CS0117

Introduction

SAP BTP is a platform engineered to integrate, automate, extend, and build AI-supported business applications and processes across the enterprise, enabling organizations to accelerate digital transformation, enhance operational efficiency, and ensure seamless integration between SAP and non-SAP systems within a unified cloud environment.

I choose SAP Build App as a platform for exploring inside SAP BTP. SAP Build Apps was used to explore low-code application development within the SAP BTP environment. The platform enables the creation of web and mobile applications through a visual, drag-and-drop interface with minimal coding. Basic features such as UI components, variables, page navigation, data binding, and logic configuration were explored, demonstrating how SAP Build Apps supports rapid application development and integration with backend services.

Demonstration

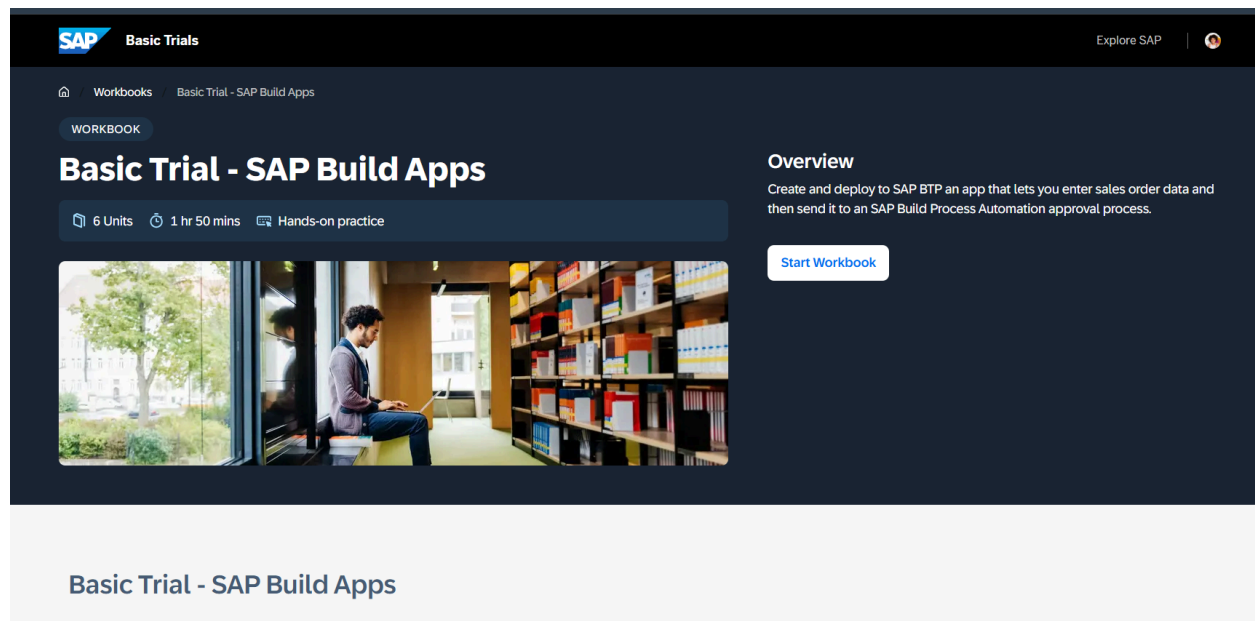

figure 1: Basic Trail SAP Build Apps interface

For the tutorial, I signed up for a basic trial on SAP Build Apps. The duration for the trial is around 30 days, during which I can explore the platform's low-code capabilities by following a guided workbook to create, test, and deploy a functional sales order application. This figure 1 above will show once I

successfully signed up for its learning course. There will be 6 topics that I have to practise hands-on and it will take around 1 hour and 50 minutes to complete.

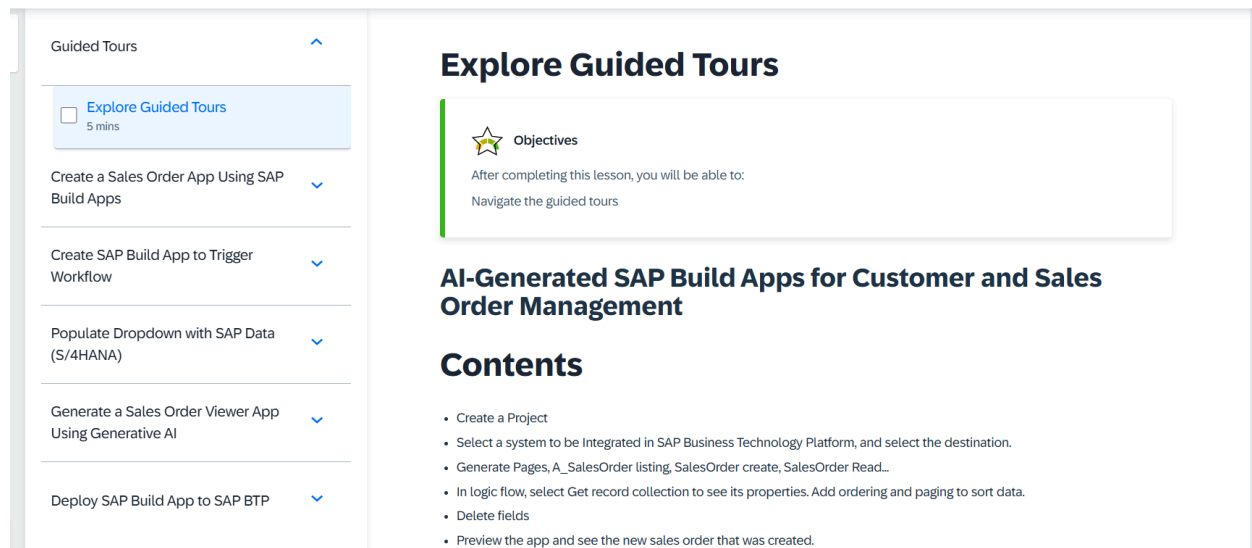

figure 2: Basic Trail SAP Build Apps tutorial

Figure 2 will appear once I start the tutorial. Below are the steps that I need to follow to complete.

Basic Trial - SAP Build Apps (Tutorial)

1. Create SAP Build App to Trigger Workflow
2. Populate Dropdown with SAP Data (S/4HANA)
3. Generate a Sales Order Viewer App Using Generative AI
4. Deploy SAP Build App to SAP BTP

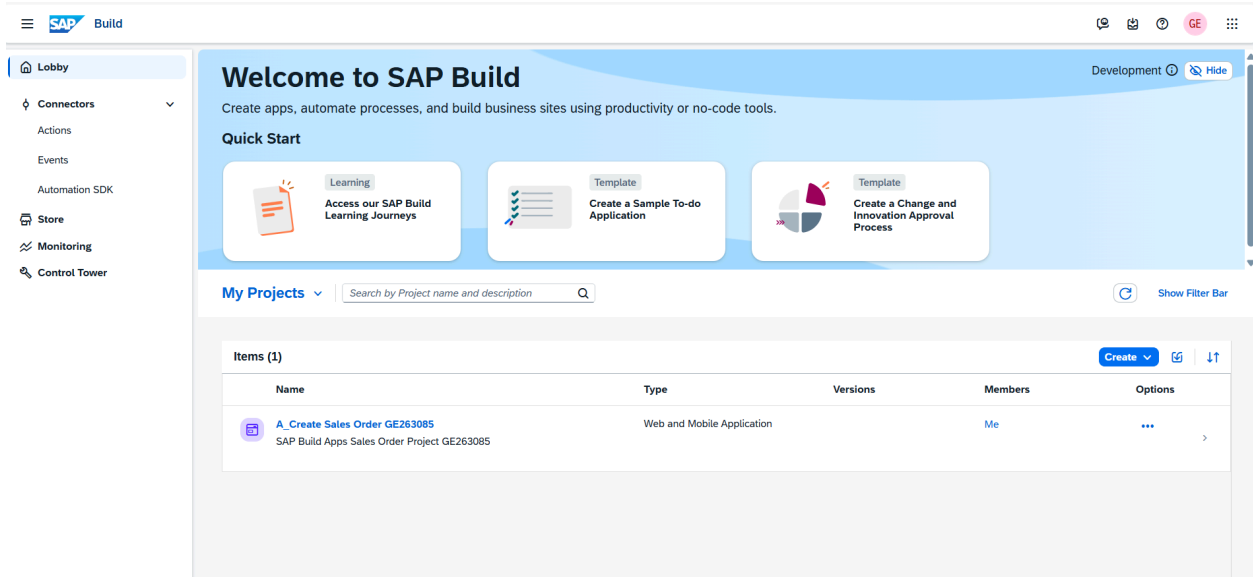

figure 3: Lobby SAP Build Apps interface

Figure 3 is a SAP Build lobby from the tutorial that serves as a centralized, intuitive start page designed to streamline the management of all low-code development projects.

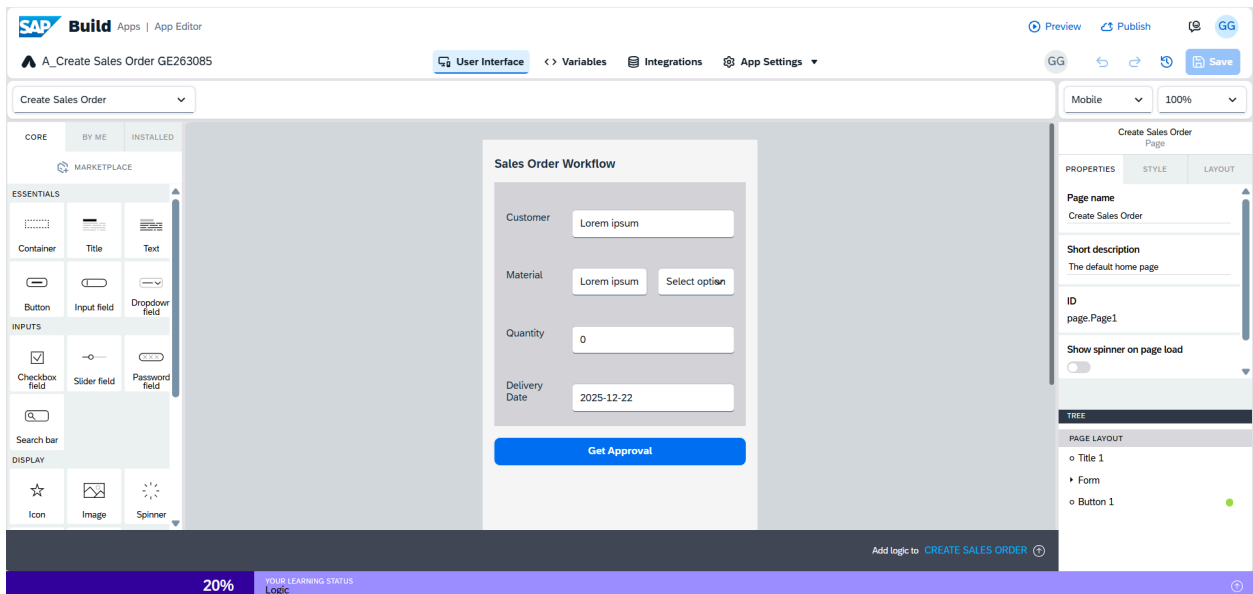

figure 4: SAP Build Apps interface

Figure 4 illustrates the end-to-end journey of building a business application within the SAP Build environment. This process begins with a structured learning path, moves through a centralized project hub, and concludes in a specialized development interface followed by the steps from the tutorial.

The screenshot displays the SAP Build Apps interface for a 'Sales Order Workflow'. On the left, a sidebar contains a 'Home page' link with a house icon and a 'A SalesOrder listing' link with a list icon. The main content area is titled 'Sales Order Workflow' and features a form with the following fields: 'Customer' (text input with placeholder 'Type here...'), 'Material' (text input with placeholder 'Type here...' and a 'Select option' dropdown menu), 'Quantity' (text input with value '0'), and 'Delivery Date' (text input with placeholder 'Type here...'). A prominent blue button labeled 'Get Approval' is positioned at the bottom of the form.

figure 5: Deployed SAP Build Apps interface

At the end of the tutorial, business applications within the SAP Build environment can be deployed to SAP BTP and ready to use for any users. Figure 5 shows an example of its interface after all the integration. Below is the link as a proof:
